DESCRIPTION

1-ARYL-1,8-NAPHTHYLIDIN-4-ONE DERIVATIVE AS TYPE IV
PHOSPHODIESTERASE INHIBITOR

5 TECHNICAL FIELD

The present invention relates to a 1-aryl-1,8-naphthylidin-4-one derivative as a selective type IV phosphodiesterase (i.e., "PDE") inhibitor and a salt, and solvate thereof and a pharmaceutical composition and a 10 type IV phosphodiesterase inhibitor containing the same as an effective component as well as an agent of preventing or treating for cytokine related diseases.

BACKGROUND ART

15 The intracellular second messenger cAMP or cGMP is broken down and deactivated by phosphodiesterase (PDE), which is classified into at least types I to VII. PDE is widely distributed in the tissue and organs of the body. Among these, type IV phosphodiesterase selectively breaks down cAMP and is found in the central tissue and in the 20 heart, lungs, kidneys, and other organs and in the various hemocyte components etc. Further, it is known to be involved in the derivation of IL-1 and IL-6, TNF- α , and other various cytokines.

25 Catechol type derivatives such as rolipram, known to be a selective inhibitor of this enzyme, quinazoline type derivatives such as nitraquazone, xanthine type derivatives such as theophylline and denbufylline, etc. are being used or developed as antidepressants, antiasthmatics, antiinflamatorics, etc. No drug has 30 however yet been developed which solves the problems such as the selectivity with other isoenzymes and various side effects. There is no satisfactory medicine which has this enzyme inhibiting action as the main mechanism for achieving the medicinal effect.

35 On the other hand, as a compound having a PDE IV inhibiting action and a naphthylidinone skeleton, for example, as a compound having a carbonyl group at the 2-

position in the 1,8-naphthylidine skeleton, there are known those described in JP-A-55-164682, WO-A-94-12499, WO-A-96-06843, etc.

Further, as a compound having a PDE IV inhibiting action and carbonyl group at the 4-position in a 1,8-naphthylidine skeleton, WO-A-97-04775 describes one where the 1-position substituent group is an ethyl group.

Further, as the method of synthesis described in this publication, the method shown in the following formula was used, based on the method of Kaminsky et al. (J. Med. Chem. 1968, 11, 160). However, the 1-position substituent group disclosed in this method is only an alkyl group.

In the above reaction process, it is only possible to use a substitution reaction using a highly reactive alkyl halide ($A-CH_2-Y$), and therefore, the substituent groups which can be introduced to the 1-position are limited.

DISCLOSURE OF INVENTION

The objects of the present invention are to provide a compound or a salt or solvate thereof, useful as a medicine for the prevention or treatment of bronchial asthma, chronic bronchitis, and other respiratory diseases, diseases relating to abnormality of nervous

system such as impaired learning, memory, and recognition relating to Alzheimer's disease, Parkinson's disease, and the like, diseases relating to mental abnormality such as maniac depression and schizophrenia, atopic dermatitis, 5 conjunctivitis, acquired immunity disorder syndrome and other inflammatory diseases, osteoarthritis, rheumatoid arthritis, and other general or local joint diseases, rheumatoid arthritis, sepsis, Crohn disease and other diseases which are related to various cytokines such as 10 tumor necrosis factor (TNF- α), and the like by selectively inhibiting the type IV phosphodiesterase and further inhibiting the production of TNF- α .

In accordance with the present invention, there is provided a 1-aryl-1,8-naphthylidin-4-one derivative 15 having the formula (I):

20

wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group,

25 R², R³, and R⁴ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a halogen atom,

30 X indicates the group NR⁵R⁶ or group OR⁷, wherein R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group, and R⁷ indicates a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a substituted or unsubstituted cycloalkyl group 35 or a salt or solvate thereof.

In accordance with the present invention, there is

also provided a 1-aryl-1,8-naphthylidin-4-one derivative having the formula (I'):

5

10 wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group, R^{2'}, R^{3'}, and R^{4'} independently indicate a hydrogen atom, or a substituted or unsubstituted lower alkyl group,

15 X' indicates the group NR⁵R⁶,

R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group

20 or a salt or solvate thereof.

In accordance with the present invention, there is also provided a pharmaceutical composition and a type IV phosphodiesterase inhibitor as well as an agent of preventing or treating for cytokine related diseases, containing a 1-aryl-1,8-naphthylidin-4-one derivative as set forth in the above formula (I) or (I') or its pharmaceutically acceptable salt or solvate as the effective ingredient.

30 Further, according to the present invention, it is possible to provide a synthesis intermediate useful for the production of a 1-aryl-1,8-naphthylidin-4-one derivative as set forth in the above general formula (I) or (I').

35 **BEST MODE FOR CARRYING OUT THE INVENTION**
The inventors engaged in intensive research to

develop a compound having a superior type IV phosphodiesterase inhibiting action and a process for producing the same and, as a result, found that a compound having the formula (I) or (I') with a carbonyl group at the 4-position in the 1,8-naphthylidine skeleton and an aryl group or heteroaryl group as the 1-position substituent group has a superior type IV phosphodiesterase inhibiting action, whereby the present invention was completed.

The preferable examples of the aryl group of the substituted or unsubstituted aryl group indicated by R^1 in the formula (I) and (I') according to the present invention are C_6 to C_{14} aryl group, for example, a phenyl group, naphthyl group, indenyl group, anthryl group, etc. More preferable example is a phenyl group. Preferable examples of the substituents for the aryl group are a hydroxyl group, a lower alkyl group, a halogen atom such as a fluorine, chlorine, bromine or iodine atom, an oxygen atom, a sulfur atom, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc.

In the specification, "lower", unless otherwise alluded to, means 1 to 8 carbon atoms, preferably 1 to 6 carbon atoms.

Preferable examples of the heteroaryl group of the substituted or unsubstituted heteroaryl group indicated by R^1 in the formula (I) or (I') of the present invention are a monocyclic or polycyclic heteroaryl group having a 5- to 7-member ring including 2 to 8 carbon atoms and 1 to 4 hetero atoms of an oxygen atom, a nitrogen atom, or a sulfur atom, for example, a pyrrole group, a furyl group, a thienyl group, an imidazolyl group, a thiazolyl group, a pyridyl group, a pyrazinyl group, an indolyl

group, a quinolyl group, an isoquinolyl group, etc. may be mentioned. The more preferable example is a pyridyl group. Examples of the preferable substituent groups of the heteroaryl group are a hydroxyl group, a lower alkyl group, a halogen atom such as a fluorine, chlorine, bromine or iodine atom, an oxygen atom, a sulfur atom, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc.

The preferable examples of the lower alkyl group indicated by R^2 , R^3 , or R^4 in the formula (I) or $R^{2'}$, $R^{3'}$ or $R^{4'}$ in the formula (I') are $C_1 - C_6$ linear or branched alkyl group such as a methyl group, ethyl group, n-propyl group, isopropyl group, isobutyl group, t-butyl group, etc. The preferable examples of the halogen atom indicated by R^2 , R^3 , or R^4 , in the formula (I), fluorine, chlorine, bromine, and iodine. The preferable examples of a combination of R^2 , R^3 , and R^4 , or a combination of $R^{2'}$, $R^{3'}$ and $R^{4'}$, are all hydrogen atoms.

The preferable examples of the alkyl group of the substituted or unsubstituted lower alkyl group indicated by R^5 or R^6 in formula (I) or (I') are C_1 to C_6 linear or branched alkyl group such as a methyl group, ethyl group, n-propyl group, isopropyl group, isobutyl group, t-butyl group, etc. The preferable examples of the substituent group of the lower alkyl group are preferably C_3 to C_6 cycloalkyl group such as a cyclopropyl group, a cyclobutyl group, a cyclopentyl group and a cyclohexyl group, C_6 to C_{14} aryl group such as a phenyl group, lower alkenyl group such as a vinyl group, etc., a halogen atom such as a fluorine, chlorine, bromine or iodine atom, a hydroxyl group, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide

group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc.

5 The preferable examples of the cycloalkyl group of the substituted or unsubstituted cycloalkyl group indicated by R⁵ or R⁶ in formula (I) or (I') are C₃ - C₆ cycloalkyl group such as a cyclopropyl group, a cyclobutyl group, a cyclopentyl group, a cyclohexyl group, etc. The preferable examples of the substituent group for the cycloalkyl group are a C₆ to C₁₄ aryl group such as a phenyl group, lower alkenyl group such as a vinyl group, etc. a hydroxyl group, a halogen atom such as a fluorine, chlorine, bromine or iodine atom, an 10 alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a 15 sulfonyl group, etc.

15 The preferable examples of the aryl group of the substituted or unsubstituted aryl group indicated by R⁵ or R⁶ in formula (I) or (I') are a C₆ to C₁₄ aryl group such as a phenyl group, a naphthyl group, an indenyl group, an anthryl group, etc. The more preferable 20 example is a phenyl group. Further, preferable examples of the substituent group for the aryl group are C₁ - C₆ linear or branched alkyl group such as a methyl group, an ethyl group, a n-propyl group, an isopropyl group, an isobutyl group and a t-butyl group, a C₆ - C₁₄ aryl group such as a phenyl group and a naphthyl group, a halogen atom such as fluorine, chlorine, bromine or iodine atom, a hydroxy group, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amido group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl 25 30 35

group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc.

Further, preferable examples of the heteroaryl group of the substituted or unsubstituted heteroaryl group indicated by R⁵ or R⁶ in formula (I) or (I') are a monocyclic or polycyclic heteroaryl group having a 5- to 7-member ring including 1 to 4 hetero atoms including an oxygen atom, a nitrogen atom, or a sulfur atom such as a pyrrole group, a furyl group, a thienyl group, an imidazolyl group, a thiazolyl group, a pyridyl group, a pyrazinyl group, an indolyl group, a quinolyl group, an isoquinolyl group, a benzimidazolyl group, a benzthiazolyl group, etc. More preferable examples are a 4-pyridyl group, a 3-pyridyl group, a 2-pyridyl group, a thiazolyl group, etc. The examples of preferable substituent groups for the heteroaryl group are a C₁ - C₆ linear or branched alkyl group such as a methyl group, an ethyl group, a n-propyl group, an isopropyl group, an isobutyl group, a t-butyl group, a C₆ - C₁₄ aryl group such as a phenyl group, a naphthyl group, a halogen atom such as fluorine, chlorine, bromine or iodine atom, a hydroxy group, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc. The preferable examples of the substituted or unsubstituted heteroaryl group indicated by R⁵ or R⁶ are a 4-pyridyl group, a 3-pyridyl group, a 3,5-dichloropyridin-4-yl group, etc.

The preferable examples of the lower alkyl group of the substituted or unsubstituted lower alkyl group indicated by R⁷ in formula (I) are a C₁ - C₆ linear or branched alkyl group such as a methyl group, an ethyl group, a n-propyl group, an isopropyl group, an isobutyl group, a t-butyl group, etc. The preferable examples of

the substituent group of the lower alkyl group are a C₆ - C₁₄ aryl group such as a phenyl group, a halogen atom such as fluorine, chlorine, bromine or iodine atom, a lower alkenyl group such as a vinyl group, etc. a cyano group, a nitro group, an amino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group.

The preferable examples of the cycloalkyl group for the substituted or unsubstituted cycloalkyl group indicated by R⁷ in formula (I) are a C₃ - C₆ cycloalkyl group such as a cyclopropyl group, a cyclobutyl group, a cyclopentyl group, a cyclohexyl group, etc. The preferable examples of the substituent group for the cycloalkyl group are a C₆ - C₁₄ aryl group such as a phenyl group, etc. a lower alkenyl group such as a vinyl group, etc. a halogen atom such as a fluorine, chlorine, bromine or iodine atom, a hydroxy group, an alkoxy group, a cyano group, a nitro group, an amino group, an alkylamino group, an amide group, an acyl group, an acyloxy group, a carboxyl group, a lower alkoxy carbonyl group, an aralkyloxycarbonyl group, a carbamoyl group, a thiol group, an alkylthio group, a sulfonyl group, etc.

The specific examples of the 1-aryl-1,8-naphthylidin-4-one derivative described in the above formula (I) or (I') of the present invention are as follows.

- (a) a 1-aryl-1,8-naphthylidin-4-one derivative where all of R², R³, and R⁴ or R^{2'}, R^{3'} and R^{4'} are hydrogen atoms
- (b) a 1-aryl-1,8-naphthylidin-4-one derivative where R¹ is a phenyl group
- (c) a 1-aryl-1,8-naphthylidin-4-one derivative where R¹ is a tolyl group
- (d) a 1-aryl-1,8-naphthylidin-4-one derivative where R¹ is an anisyl group
- (e) a 1-aryl-1,8-naphthylidin-4-one derivative

where R^1 is a phenyl group substituted with a halogen atom.

(f) a 1-aryl-1,8-naphthylidin-4-one derivative
where R^1 is a pyridyl group

5 (g) a 1-aryl-1,8-naphthylidin-4-one derivative
where R¹ is a thiazolyl group

(h) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R⁵ or R⁶ is a hydrogen atom

10 (i) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R^5 or R^6 is 4-pyridyl group and the other is
a hydrogen atom

(j) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R^5 or R^6 is 3-pyridyl group and the other is
a hydrogen atom

15 (k) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R⁵ or R⁶ is a 2-pyridyl group and the other
is a hydrogen atom

(1) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R^5 or R^6 is a 2,6-dichlorophenyl group and
the other is a hydrogen atom

(m) a 1-aryl-1,8-naphthylidin-4-one derivative
where one of R⁵ or R⁶ is a 3,5-dichloropyridin-4-yl group
and the other is a hydrogen atom

(n) a 1-aryl-1,8-naphthylidin-4-one derivative
25 where X is a group NR^5R^6

The compound of the present invention has one or more asymmetric carbon atoms. Based on this, there are (R)-isomers, (S)-isomers, and other optical isomers, racemics, diastereomers, etc. Further, depending on the type of the substituent group, there are double bonds, and therefore, there are also (Z)-isomers, (E)-isomers, and the other geometrical isomers. The present invention includes these isomers separated from each other or in mixtures.

35 The compounds of the present invention include those capable of forming salts with acids. As the salts, acid

addition salts with a mineral acid such as hydrochloric acid, a hydrobromic acid, a hydroiodic acid, a sulfuric acid, a nitric acid, a phosphoric acid, and with an organic acid such as a formic acid, an acetic acid, a 5 propionic acid, an oxalic acid, a malonic acid, a succinic acid, a fumaric acid, a maleic acid, a lactic acid, a malic acid, a citric acid, a tartaric acid, a picric acid, a methanesulfonic acid, a trichloroacetic acid, a trifluoroacetic acid, an aspartic acid, a 10 glutamic acid. Further, the compounds of the present invention can be isolated as a hydrate, ethanol, isopropanol, or other solvate or various crystalline substance.

15 The compound of formula (I) or (I') according to the present invention may be synthesized by, for example, the following method.

10 wherein, R^1 , R^2 , R^3 , R^4 , R^5 and R^6 are as defined above and
 R^7 indicates R^1 as defined above except for a hydrogen
atom or a protective group of the carboxylic acid such as
a benzyl group, an allyl group, etc.

To carry out the present method, a compound (V) is obtained from the compound (VI) according to a known method (for example, J. Med. Chem. 1986, 29, 2363, ibid. 1985, 28, 1558). This reaction causes 1 to 3 equivalents, preferably 1.5 equivalents, based upon the compound (VI), of a trialkylformate such as triethylformate etc. to act on the compound (VI) in 10 to 20 equivalents of acetic anhydride at 100 to 140°C and distills off the solvent after the end of the reaction so as to obtain the desired compound (V). If necessary, the resultant product may be purified by vacuum distillation, etc.

25 Note that the starting material, that is, the compound (VI), is either a known compound or is obtained from ethyl malonate magnesium salt, 2-chloronicotinic acid, 2,6-dichloronicotinic acid, 2-chloro-6-methylnicotinic acid, or the like in accordance with a known method (for example, J. Med. Chem. 1986, 29, 2363).
30 It is possible to obtain the compound (IV) from the compound (V) obtained according to a known method (for example, J. Med. Chem. 1986, 29, 2363, ibid. 1985, 28, 1558). One equivalent, with respect to the compound (V),
35 of a commercially available (or known) primary arylamine or heteroarylamine (VII) (for example, aniline,

aminonaphthalene, aminopyridine, aminochloropyridine, aminofluoropyridine, nitroaniline, phenylenediamine, etc.) is used in halogenated hydrocarbon such as 5 methylene chloride or aromatic hydrocarbon such as toluene, benzene, or ether such as diethyl ether, tetrahydrofuran, or a mixture thereof at 0°C to room temperature. After the end of the reaction, the resultant product is diluted with an organic solvent, which is not miscible with water, then is successively 10 washed with water and saturated saline. The solvent is then distilled off, whereupon it is possible to obtain the desired compound (IV). If necessary, the resultant product may be purified by column chromatography etc.

The compound (IV) obtained may be processed by a 15 known method (for example, J. Med. Chem. 1986, 29, 2363, ibid. 1985, 28, 1558) to obtain a compound (III). 1 to 1.2 equivalents, based on the compound (IV), of an alkali metal hydride such as sodium hydride, potassium hydride, or lithium diisopropylamide, lithium 20 hexamethyldisilazane, or other strong base, preferably sodium hydride, is used in a halogenated hydrocarbon such as methylene chloride, an aromatic hydrocarbon such as toluene, benzene or an ether such as diethyl ether, tetrahydrofuran, or a mixture thereof at 0°C to room 25 temperature. After the end of the reaction, the resultant product is diluted with an organic solvent, which is not miscible with water, then is successively washed with water and saturated saline. The solvent is then distilled off, whereupon it is possible to obtain 30 the desired compound (III). If necessary, the resultant product may be purified by column chromatography etc.

The compound (III) thus obtained is hydrolyzed 35 according to a known method to obtain a compound (II). The method differs depending on the R⁷, but normally can be performed under basic conditions (for example, J. Med. Chem. 1984, 27, 292) or acidic conditions (J. Med. Chem.

1986, 29, 2363).

Under basic conditions, 1 to 1.2 equivalents, based upon the compound (III), of alkali metal hydroxide such as sodium hydroxide, potassium hydroxide, is used in water or an alcohol such as ethanol, methanol, or ether such as diethyl ether, tetrahydrofuran, dioxane, or a mixture thereof at room temperature to 60°C. After the end of the reaction, the reaction solution is made weakly acidic, is diluted with an organic solvent, which is not miscible with water, and is successively washed with water and saturated saline. The solvent is then distilled off to obtain the desired compound (II). If necessary, the resultant product may be purified by recrystallization etc. Under acidic conditions, an acid catalyst such as sulfuric acid, hydrogen chloride, is made to act in water or an alcohol such as ethanol, methanol, or an ether such as diethyl ether, tetrahydrofuran, dioxane, or a mixture thereof at 60°C to 100°C. After the end of the reaction, the solvent is distilled off to obtain the desired compound (II). If necessary, the resultant product may be purified by recrystallization etc.

When employing a special substituent group as a protective group of the carboxylic acid in R' of formula (VI), it is also possible to convert the substance to the compound (II) by that substituent group under neutral conditions. For example, when employing a benzyl group in R', it is possible to convert the substance to the compound (II) by hydrolysis under neutral conditions.

When an allyl group is employed in R', it is possible to convert it to the compound (II) by formic acid in the presence of a Pd(0) complex. The compound (II) obtained can be used to obtain the compound (Ia) in the compounds having the formula (I) of the present invention where X is the group NR⁵R⁶ according to a known method (Fourth

Experimental Chemical Seminar, vol. 22, p. 137, published

by MARUZEN).

The reaction synthesizes an acid amide from a carboxylic acid (II) and commercially available or known amine component (VIII) (for example, methylamine, 5 ethylamine, isopropylamine, benzylamine, phenylethylamine, aniline, toluidine, aminobenzoic acid, aminoacetophenone, dichloroaniline, aminonaphthalene, aminopyridine, aminodichloropyridine, aminofluoropyridine, phenylenediamine, diaminopyridine, 10 nitroaniline, etc.). This may be done by various methods, but these may be roughly divided into three groups. The first are methods where a condensation agent such as dicyclohexyl carbodiimide, carbonyl diimidazole, is used to cause a reaction between a carboxylic acid 15 (II) and amine component (VIII). The second are methods where a carboxylic acid (II) is converted to an acid halide, then allowed to react with an amine component (VIII). The third are methods where carboxylic acid (II) is converted to an acid anhydride, then allowed to react 20 with an amine component (VIII).

For example, as a method going through an acid halide, 1 to 5 equivalents, based upon the carboxylic acid (II), of an acid halogenating agent such as thionyl chloride, oxalyl chloride, phosphorus pentachloride, is 25 used a halogenated hydrocarbon such as methylene chloride, chloroform aromatic hydrocarbon such as toluene, benzene, an ether such as tetrahydrofuran, 1,4-dioxane, or a mixture thereof or without using a solvent at room temperature to 100°C. After the end of the 30 reaction, the solvent is distilled off to obtain the acid halide. The acid halide may be used as it is, without purifying for the next reaction. 2 to 3 equivalents, based on the acid halide, of the amine component (VIII) is reacted in a halogenated hydrocarbon such as methylene 35 chloride, aromatic hydrocarbon such as toluene, benzene, an ether such as diethyl ether, or a mixture thereof at 0°C to room temperature, or 1 to 1.5 equivalents of the

amine component (VIII) is reacted in the presence of 1 to 3 equivalents of an amine such as triethylamine, diisopropylethylamine, pyridine, or the amine component (VIII) may be reacted with the acid halide component after reacting with an alkali metal hydride such as sodium hydride or potassium hydride to form the corresponding amine metal salt. After the end of the reaction, the substance is diluted with an organic solvent which is not miscible with water, then is successively washed with water and saturated saline. The solvent is then distilled off to obtain the desired compound (Ia). If necessary, the product may be purified by column chromatography, recrystallization, etc.

In the process of the present invention, it was possible to introduce R¹ substituent group, which was difficult to be introduced, by the use thereof in the form of the amine component (VII).

The type IV phosphodiesterase inhibiting activities of the compounds according to the present invention were confirmed by the following test:

(1) Method of Measurement of Type IV Phosphodiesterase Inhibiting Activity

The following assay was used to evaluate the ability of the compound of the present invention to suppress type IV phosphodiesterase, according to Biochemical Pharmacol. 48 (6), 1219-1223 (1994).

1) Type IV phosphodiesterase activity fractions were prepared as follows. Human histiocytic lymphoma cell line U937 was cultured in an RPMI1640 medium containing 10% fetal calf serum to obtain 10⁹ cells of U937. The cells were recovered by centrifugation and suspended in 40 ml of buffer A (20 mM bis-tris, 5 mM 2-mercaptoethanol, 2 mM benzamidine, 2 mM EDTA, 0.1 mM 4-(2-aminoethyl)benzensulfonyl hydrochloride, 50 mM sodium acetate, pH = 6.5). The cells were broken by a sonication and centrifuged (4°C, 10,000G, 10 minutes) to

obtain a supernatent. This was filtered by a 0.45 μ m filter to obtain the soluble fraction.

5 The soluble fraction obtained was applied into a 1 x 10 cm DEAE Sepharose column equalibrated with the buffer A. 120 ml of the buffer A containing a linear gradient solution of 0.05 to 1 M sodium acetate was used to separate the phosphodiesterase and recover 24 5-ml fractions. Each of the fractions was measured for the 10 cAMP phosphodiesterase activity. The fractions having cAMP phosphodiesterase activity which could be inhibited by 30 μ M rolipram (selective type IV phosphodiesterase inhibitor) were collected and used as a stored solution for examination of the type IV phosphodiesterase inhibiting activity.

15 2) The test compound was reacted at a desired concentration in a reaction mixture containing 20 mM tris-HCl (pH7.5), 1 mM MgCl₂, 100 μ M EDTA, 330 μ g/ml calf serum albumin, 10 μ g/ml 5'-nucleotidase, 0.4 μ Ci ³H-cAMP (0.28 mM cAMP) and the type IV phosphodiesterase stored 20 solution at 30°C for 30 minutes. QAE-Sephadex suspended in 10 mM of hepes-Na (pH-7.0) was added to the reaction mixture which was then allowed to stand for 5 minutes, 25 then the supernatant was obtained, QAE-Sephadex was further added, to the supernatant, and was allowed to stand for 5 minutes, then the supernatant was obtained and measured for radioactivity.

The IC₅₀ was measured for each compound as the concentration of the test compound inhibiting 50% of the type IV phosphodiesterase activity.

30 (2) Type IV Phosphodiesterase Inhibiting Activity of Various Compounds

35 The phosphodiesterase inhibiting activity IC₅₀ obtained by the above method of measurement is shown in the following Table I. As the typical control agent, Rolipram (Tocris) was used.

Further, as a Comparative Example, the compound N-

5 (2-(4-pyridyl)ethyl)-1-ethyl-7-methyl-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide described in WO-A-97-04775 (1997), page 17, Example 1 was synthesized and measured similarly for inhibiting activity. The phosphodiesterase inhibiting activity IC₅₀ obtained is shown in Table I.

45 As a result of the test on the phosphodiesterase inhibiting activity, it was confirmed that the 1-aryl-1,8-naphthyllidin-4-one derivative according to the present invention exhibited an excellent inhibitory effect.

50 The inhibitory activities of the compound of the

present invention on TNF- α production by LPS stimulated macrophages were confirmed by the following test:

(1) Method of Measurement of TNF- α Production Inhibitory Activity by LPS Stimulated Macrophages

5 The following assay was used to evaluate the ability of the compound of the present invention to suppress TNF- α production by LPS stimulated macrophages according to Immuno pharmacol. 29, 121-127 (1995).

10 1) 6 to 10 week old female BALB/c mice were used, 2 ml portions of thioglycolate were intraperitoneally administered, and the abdominal cavities were washed by 10 ml of PBS after 4 days, whereby 1 to 2 \times 10⁷ peritoneal cells were obtained per mouse. These were suspended in a hemocyte solution (0.75% ammonium 15 chloride, 17 mM tris-hydrochlorate buffer, pH7.2), centrifuged, then resuspended in an RPMI1640 medium including 10% fetal calf serum and seeded in a 96-well cell culture plate at a density of 1 \times 10⁵ cells/50 μ l/well. Since these cells adhered strongly to the 20 tissue culture plate and were positive in nonspecific esterase staining, they were used for the test as mouse peritoneal macrophages. Mouse peritoneal macrophages were precultured overnight at 37°C in 5% CO₂ for the experiment.

25 2) E. Coli (serum type 055:B5) derived LPS was dissolved in PBS in a concentration of 1 mg/ml, then sterilized by filtration. The test compound was dissolved in DMSO to make a 1000-fold concentration solution of the final concentration of use. 10 μ l of the 30 above LPS stock solution (final concentration 10 μ g/ml) and 1 μ l of the tested substance stock solution were added and mixed in 0.5 ml of RPMI1640 medium containing 10% fetal calf serum. This was added to the above cells at 50 μ l/well and cultured for 8 hours. The cultured 35 supernatant was recovered from each well and the TNF- α concentration was measured by the ELISA method

(Cytoscreen® Immunoassay Kit Mouse TNF- α , BioSource International).

3) The IC₅₀ was calculated for each compound as the concentration of the test compound inhibiting 50% of the TNF- α production caused by LPS stimulus.

5 (2) TNF- α Production Inhibitory Activity by LPS Stimulated Macrophages

10 The IC₅₀ values for the TNF- α production inhibitory activity obtained by the above method are shown in the following Table II. The comparative example was the compound described in WO-A-97-04775, Example 1, mentioned above.

From the above results, it was confirmed that the compound of the present invention exhibits an excellent activity inhibiting the production of TNF- α .

The compound of the present invention is useful as a pharmaceutical composition for the prevention or treatment of bronchial asthma, chronic bronchitis, and other respiratory diseases, diseases relating to abnormality of the nervous system such as Alzheimer's Disease, Parkinson's Disease, diseases relating to mental abnormalities such as maniac depression, inflammatory

5 diseases such as atopic dermatitis, acquired immunity disorder syndrome general or local joint diseases such as osteoarthritis, rheumatoid arthritis, Crohn disease, sepsis, endotoxin shock and other diseases related to tumor necrosis factor (TNF- α) or other various cytokine (IL-1, IL-6, etc.), and the like by selectively inhibiting the type IV phosphodiesterase and further inhibiting the production of TNF- α .

10 The type IV phosphodiesterase inhibitor of the present invention is useful as an agent for the prevention or treatment of specifically respiratory diseases (for example, bronchial asthma, chronic bronchitis, pneumonia type diseases, adult respiratory distress syndrome, etc.), diseases relating to 15 abnormality of the nervous system (for example, impaired learning, memory, and recognition relating to Alzheimer's Disease, Parkinson's Disease, and the like, multiple lateral sclerosis, senile dementia, amyotrophic lateral sclerosis, muscular dystrophy, etc.), diseases relating to 20 mental abnormalities (for example, maniac depression, schizophrenia, neurosis, etc.), inflammatory diseases (for example, atopic dermatitis, conjunctivitis, acquired immunity disorder syndrome, keloids, etc.), general and local joint diseases (for example, osteoarthritis, 25 rheumatoid arthritis, and other general or local joint diseases, gouty arthritis, rheumatoid arthritis, nodose rheumatism, etc.), tumor necrosis factor (TNF) and other cytokine (IL-1, IL-6, etc.) related diseases (for example, psoriasis, rheumatoid arthritis, Crohn disease, 30 septicemia, sepsis, endotoxic shock, nephritis, pneumonia, bacterial or viral infection, cardiac incompetence, atherosclerosis, cardiac infarction, etc.) etc.

35 For use of the effective ingredient of the present invention as a pharmaceutical or a type IV phosphodiesterase inhibitor, one or more types of the compound of the present invention may be formulated and

formed into preparations suitable for the method of administration according to ordinary methods. For example, for oral administration, capsules, tablets, granules, powders, syrups, dry syrups, and other 5 preparations may be mentioned, while for nonoral administration, injections and also rectal suppositories, vaginal suppositories, and other suppositories, sprays and other nasal agents, ointments, transdermal absorption type tapes, and other transdermal absorption agents may 10 be mentioned.

The clinical dosage of the compound of the present invention differs depending on the symptoms, the severity of the disease, the age, and complications of the patient to which the compound is being administered and differs 15 depending on the preparation as well, but in the case of oral administration is normally 1 to 1000 mg, preferably 1 to 500 mg, more preferably 5 to 100 mg. per adult per day as effective ingredient, and in the case of nonoral administration is one-tenth to one-half of the case of 20 oral administration. The dosage may be suitably adjusted according to the age, symptoms, etc. of the patient.

The compound of the present invention is a selective inhibitor for type IV phosphodiesterase and has over 10-times the selectivity over other phosphodiesterase 25 isoenzymes (i.e., PDE I-III, V and VII). Due to this, it is expected that there will be few side effects due to the action of inhibiting other phosphodiesterase isoenzymes. The compound of the present invention is low in toxicity. The compound is expected to be high in 30 safety. For example, the compounds of Examples 99, 102, 103, 106, 139 and 141 exhibited no death when 10 mg/kg per day was administered for 28 days to mice.

The 1-aryl-1,8-naphthylidin-4-one derivative or its 35 pharmaceutically acceptable salt or solvate of the present invention is useful as a pharmaceutical composition for the prevention or treatment of diseases involving type IV phosphodiesterase. As specific

examples of diseases involving type IV phosphodiesterase, for example, respiratory diseases (for example, bronchial asthma, chronic bronchitis, pneumonia type diseases, adult respiratory distress, etc.), diseases relating to 5 abnormality of the nervous system (for example, impaired learning, memory, and recognition relating to Alzheimer's Disease, Parkinson's Disease, and the like, multiple lateral sclerosis, senile dementia, amyotrophic lateral sclerosis, muscular dystrophy, etc.), diseases relating to 10 mental abnormalities (for example, maniac depression, schizophrenia, neurosis, etc.), inflammatory diseases (for example, atopic dermatitis, conjunctivitis, acquired immunity disorder syndrome, keloids, etc.), general and local joint diseases (for example, osteoarthritis, 15 rheumatoid arthritis, and other general or local joint diseases, gouty arthritis, rheumatoid arthritis, nodose rheumatism, etc.), tumor necrosis factor (TNF) and other cytokine (IL-1, IL-6, etc.) related diseases (for example, psoriasis, rheumatoid arthritis, Crohn disease, 20 septicemia, sepsis, endotoxic shock, nephritis, pneumonia, bacterial or viral infection, cardiac incompetence, atherosclerosis, cardiac infarction, etc.) etc. may be mentioned.

EXAMPLE

25 The present invention will now be further explained in detail by, but is by no means limited to, the following Examples.

Example 1

Synthesis of ethyl 3-(4-fluoroanilino)-2-(2-chloronicotinoyl)acrylate

30 A mixed solution of ethyl 2-chloronicotinoyl acetate (410 mg, 1.8 mmol) in triethylformate (449 μ l, 2.7 mmol) and acetic anhydride (2.04 ml, 21.6 mmol) was heated and stirred at 130°C for 1 hour. The solution was cooled, 35 then the solvent was distilled off under vacuum to obtain an oily substance. This oily substance was dissolved in methylene chloride (7 ml), 4-fluoroaniline (188 μ l, 1.98

mmol) was added at room temperature, and the solution was stirred at that temperature for 1.5 hours. Next, the solvent was distilled off under vacuum and the residue was purified by silica gel column chromatography (hexane/ethyl acetate = 2/1) to obtain the above-identified compound (510 mg, 81%) as a slightly yellow crystal.

Example 2

15 Synthesis of ethyl 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylate

Sodium hydride (abt. 60% oil suspension 429 mg, 10.7 mmol) was added to a tetrahydrofuran (45 ml) solution of ethyl 3-(4-fluoroanilino)-2-(2-chloronicotinoyl) acrylate (3.56 g, 10.2 mmol) at 0°C and the solution was stirred at that temperature for 5 minutes. It was further stirred at room temperature for 1 hour, then water (100 ml) was added and extraction was performed with ethyl acetate (200 ml). Next, the organic layer was washed with saturated saline (50 ml), then dried over anhydrous sodium sulfate, then the solvent was distilled off under vacuum. The precipitated crystal was washed with diethyl ether and the crystal was obtained by filtration to obtain the above-identified compound (2.84 g, 89%) as a colorless crystal.

Synthesis of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid

10 1N sodium hydroxide solution (5.3 ml, 5.3 mmol) was
added to a mixed solution of ethyl 1-(4-fluorophenyl)-
1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylate (1.5 g,
4.8 mmol) in tetrahydrofuran (40 ml) and ethanol (50 ml)
at room temperature and the solution was stirred at that
15 temperature for 1.5 hours. Next, this was diluted by
ethyl acetate (200 ml) and 1N hydrochloric acid (5.5 ml)
was added. The organic layer was successively washed
with water (30 ml) and saturated saline (30 ml), then
dried over anhydrous sodium sulfate, then the solvent was
20 distilled off under vacuum. The precipitated crystal was
washed by diethyl ether, then the crystal was obtained by
filtration to obtain the above-identified compound (1.2
g, 88%) as a colorless crystal.

Example 4

Synthesis of ethyl 1-phenyl-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylate

35 A mixed solution of ethyl 2-chloronicotinoyl acetate (455 mg, 2 mmol) in triethylformate (500 μ l, 3.0 mmol) and acetic anhydride (2.4 ml) was heated and stirred at 130°C for 1.5 hour. The solution was cooled, then the solvent was distilled off under vacuum to obtain an oily

substance. This oily substance was dissolved in methylene chloride (7 ml), aniline (200 μ l, 2.2 mmol) was added at room temperature, and the solution was stirred for 1.5 hours. Sodium hydride (abt. 90 mg of 60% oil suspension, 2.25 mmol) was added, after ice cooling, and the solution was stirred at that temperature for 5 minutes. This was further stirred at room temperature for 1 hour, then water (20 ml) was added and extraction was performed with ethyl acetate (20 ml). Next, the 10 organic layer was washed with saturated saline (10 ml), then dried over anhydrous sodium sulfate and the solvent was distilled off under vacuum. The precipitated crystal was washed with diethyl ether, then the crystal was obtained by filtration to obtain the above-identified 15 compound (411 mg, 70%) as a colorless crystal.

10 Synthesis of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

15 Thionyl chloride (13.3 μ l, 0.18 mmol) was added to a tetrahydrofuran (1 ml) solution of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid (26 mg, 0.09 mmol) at room temperature and the solution was stirred at 75°C for 1 hour. The solvent was distilled off under vacuum, whereby a colorless crystal as an acid chloride was obtained. Next, ammonium hydroxide (28% aqueous solution, 27.8 μ l, 0.46 mmol) was added to a tetrahydrofuran (1.5 ml) solution of this acid chloride at room temperature and the solution was stirred at that temperature for 20 minutes. Next, the reaction solution was diluted with ethyl acetate (20 ml) and successively washed with water (5 ml) and saturated saline (5 ml), then dried over anhydrous sodium sulfate, then the solvent was distilled off under vacuum. The precipitated crystal was washed with diisopropyl ether, then the crystal was obtained by filtration to obtain the above-identified compound (14 mg, 54%) as a slightly brown crystal.

Synthesis of 1-(4-fluorophenyl)-N-isopropyl-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

20 Thionyl chloride (14.6 μ l, 0.20 mmol) was added to a tetrahydrofuran (1 ml) solution of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid (30 mg, 0.10 mmol) at room temperature and the solution was stirred at 75°C for 1 hour. The solvent was distilled off under vacuum to obtain a colorless crystal as an acid chloride. Next, isopropylamine (19 μ l, 0.22 mmol) and triethylamine (55 μ l, 0.40 mmol) were added to a dichloromethane (2 ml) solution of this acid chloride at room temperature and the solution was stirred at that temperature overnight. Next, the reaction solution was successively washed with water (5 ml) and saturated saline (5 ml), then dried over anhydrous sodium sulfate, then the solvent was distilled off under vacuum. The precipitated crystal was washed by diethyl ether, then the crystal was obtained by filtration to obtain the above-identified compound (29 mg, 42%) as a colorless crystal.

Example 72

Synthesis of 1-(4-fluorophenyl)-N-(2,6-xylidyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

To a tetrahydrofuran (1 ml) solution of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid (28 mg, 0.10 mmol), oxalyl chloride (10 μ l, 0.114 mmol) and N,N-dimethylformamide (10 μ l) were added at a temperature of 0°C, followed by stirring at the same temperature for 1 hour. When the solvent was distilled off under vacuum, the acid chloride was obtained as a colorless crystal. 2,6-xylidine (14 μ l, 0.12 mmol) was dissolved in N,N-dimethylformamide (2 ml) and sodium hydride (abt. 5.0 mg of 60% oil suspension, 0.125 mmol), followed by stirring at 70°C for 3 hours. After allowing to cool to room temperature, the above acid chloride was added and stirred at the same temperature for 19 hours. The reaction mixture was diluted with ethyl acetate (20 ml) and was successively washed with water (5 ml), an aqueous saturated sodium hydrogen carboxylate solution (5 ml), and saturated saline water (5 ml), followed by dried over anhydrous sodium sulfate. The solvent was then distilled off under vacuum. The residue was suspended with diethylether and the precipitate was filtered to obtain the above-identified compound (17 mg, 44%) as a colorless crystal.

25 Example 105

30 Synthesis of N-(2-chloropyridin-3-yl)-1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

The same reaction was carried out as in Example 53, except for using 3-amino-2-chloropyridine, instead of isopropylamine, to obtain the above-identified compound (49 mg, 83%) as a colorless crystal.

IR(KBr)cm⁻¹: 3450, 1684, 1615, 1540, 1508, 1482, 1428, 1396, 1332, 1221, 788. MS(FAB) 395[M+1]⁺. ¹H-NMR(CDCl₃): δ 7.28-7.32(3H, m) 7.46(2H, m) 7.53(1H, dd, J=4.5 and 8.0Hz) 8.14(1H, dd, J=1.5 and 4.5Hz) 8.74(1H, dd, J=1.8 and 4.5Hz) 8.94(1H, m) 9.05(1H, s) 12.47(1H, brs).

Example 106

Synthesis of N-(3,5-dichloropyridin-4-yl)-1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

Thionyl chloride (54 μ l, 0.74 mmol) was added to a tetrahydrofuran (2 ml) solution of 1-(4-fluorophenyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid (70 mg, 0.25 mmol) at room temperature and the solution was refluxed for 1 hour. The solvent was distilled off under vacuum, whereby a colorless crystal of acid chloride was obtained. Next, triethylamine (103 μ l, 0.74 mmol), 4-amino-3,5-dichloropyridine (44 mg, 0.271 mmol), and N,N-dimethylaminopyridine (2 mg) were added to a methylene chloride (2 ml) solution of this acid chloride at room temperature and the solution was stirred at that temperature for 19 hours. The reaction solution was diluted with ethyl acetate (20 ml) and successively washed with water (5 ml) and saturated saline (5 ml), then dried over anhydrous sodium sulfate, then the solvent was distilled off under vacuum. The residue was purified by silica gel column chromatography (hexane/ethyl acetate = 1.5/1) to obtain the above-identified compound (52 mg, 49%) as a colorless crystal.

IR(KBr)cm⁻¹: 3068, 1692, 1619, 1546, 1506, 1482, 1417, 1327, 1222, 790. MS(FAB) 428[M+1]⁺ ¹H-NMR(CDCl₃): δ 7.26-7.31(2H, m) 7.44-7.47(2H, m) 7.53(1H, dd, J=4.5 and 8.1Hz) 8.57(2H, s) 8.74(1H, dd, J=2.0 and 4.5Hz) 8.92(1H, dd, J=2.0 and 7.9Hz) 9.07(1H, s) 12.0(1H, brs).

Example 107

Synthesis of 1-(4-fluorophenyl)-N-(4-pyrimidyl)-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

The same reaction was carried out as in Example 53, except for using 4-aminopyrimidine, instead of isopropylamine, to obtain the above-identified compound (38 mg, 70%) as a slightly yellow crystal.

to a pyridine (2 ml) solution of this acid chloride at room temperature and the solution was stirred at 60°C for 3 hours. The reaction solution was diluted with water (10 ml), whereupon the crystal precipitated. The precipitated crystal was obtained by filtration and the crystal was washed with diethyl ether to obtain the above-identified compound (70 mg, 69%) as a colorless crystal.

Example 118

Synthesis of N-(3,5-dichloropyridin-4-yl)-1-phenyl-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxamide

To a tetrahydrofuran (1 ml) solution of 1-phenyl-1,4-dihydro[1,8]naphthylidin-4-one-3-carboxylic acid (27 mg, 0.10 mmol), thionyl chloride (15 μ l, 0.20 mmol) and N,N-dimethyl formamide (10 μ l) were added, followed by stirring on heating under reflux for 1 hour. The solvent was distilled off to obtain the acid chloride as a colorless crystal. 4-amino-3,5-dichloropyridine (18 mg, 0.11 mmol) was dissolved in N,N-dimethyl formamide (2 ml) and sodium hydride (abt. 60% oil suspension 5.0 mg, 0.125 mmol) was added thereto, followed by stirring at room temperature for 30 minutes. The above acid chloride was added thereto, followed by stirring at the same temperature for 19 hours. The

reaction mixture was diluted with ethyl acetate (20 ml) and successively washed with water (5 ml), an aqueous saturated sodium hydrogen carboxylate solution (5 ml) and saturated saline water (5 ml), and dried over anhydrous sodium sulfate, followed by distilling off the solvent under vacuum. The residue was suspended in ether to obtain the above-identified compound (30 mg, 73%) by filtration as a colorless crystal.

INDUSTRIAL APPLICABILITY

As explained above, the 1-aryl-1,8-naphthylidin-4-
10 one derivatives and the salts and solvates thereof
according to the present invention have type IV
phosphodiesterase inhibiting action, and therefore, are
effective as a pharmaceutical composition for the
prevention or treatment of respiratory diseases, diseases
15 relating to abnormalities of the nervous system, diseases
relating to mental abnormalities, inflammatory diseases,
joint diseases, various cytokine related diseases, etc.

CLAIMS

1. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative having the formula (I):

5

10

wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group,

15 R², R³, and R⁴ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a halogen atom,

20 X indicates a group NR⁵R⁶ or a group OR⁷, wherein R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group, and R⁷ indicates a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a substituted or unsubstituted cycloalkyl group 25 or a salt or solvate thereof.

30 2. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt, or solvate as claimed in claim 1, wherein all of R², R³, and R⁴ in the formula (I) are hydrogen atoms.

35 3. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 1 or 2, wherein R¹ in the formula (I) is a phenyl group.

4. A type IV phosphodiesterase inhibitor

comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 1 or 2, wherein R¹ in the formula (I) is a phenyl group substituted with at least one substituent selected from the group consisting of lower alkyl groups, lower alkoxy groups, halogen atoms and a nitro group.

5 5. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof, as claimed in claim 1 or 2, wherein R¹ in the formula (I) is a substituted or unsubstituted pyridyl group.

10 6. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 1 or 2, wherein R¹ in the formula (I) is a substituted or unsubstituted pyrazinyl group.

15 7. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 1 or 2, wherein R¹ in the formula (I) is a substituted or unsubstituted thiazolyl group.

20 8. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a hydrogen atom.

25 9. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a substituted or unsubstituted phenyl group and the other is a hydrogen

atom.

10. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a substituted or unsubstituted pyridyl group and the other is a hydrogen group.

10 11. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a 2,6-dichlorophenyl group and the other is a hydrogen atom.

15 12. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a 3,5-dichloropyridin-4-yl group and the other is a hydrogen atom.

20 25 13. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof, as claimed in any one of claims 1 to 7, wherein one of R⁵ or R⁶ in the formula (I) is a 4-pyridyl group and the other is a hydrogen atom.

30 14. A 1-aryl-1,8-naphthylidin-4-one derivative having the formula (I'):

wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group, R², R³, and R⁴ independently indicate a hydrogen atom, or a substituted or unsubstituted lower alkyl group,

5 group,

X' indicates the group NR⁵R⁶,

10 R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group), or a salt or solvate thereof.

15 15. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14, wherein all of R², R³, and R⁴ in the formula (I') are hydrogen atoms.

16. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a phenyl group.

20 17. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a phenyl group substituted with a lower alkyl group.

25 18. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt, or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a phenyl group substituted with a lower alkoxy group.

30 19. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a phenyl group substituted with a halogen atom.

35 20. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a phenyl group substituted with a nitro group.

21. A 1-aryl-1,8-naphthylidin-4-one derivative or a

salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a substituted or unsubstituted pyridyl group.

22. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a substituted or unsubstituted pyrazinyl group.

23. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in claim 14 or 15, wherein R¹ in the formula (I') is a substituted or unsubstituted thiazolyl group.

24. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a hydrogen atom.

25. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a substituted or unsubstituted phenyl group and the other is a hydrogen atom.

26. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a substituted or unsubstituted pyridyl group and the other is a hydrogen atom.

27. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a 2,6-dichlorophenyl group and the other is a hydrogen atom.

28. A 1-aryl-1,8-naphthylidin-4-one derivative or a salt or solvate thereof as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a 3,5-dichloropyridine-4-yl group and the other is a hydrogen atom.

29. A 1-aryl-1,8-naphthylidin-4-one derivative or a

salt or solvate thereof, as claimed in any one of claims 14 to 23, wherein one of R⁵ or R⁶ in the formula (I') is a 4-pyridyl group and the other is a hydrogen atom.

5 30. A type IV phosphodiesterase inhibitor comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative having the formula (I'):

15 wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group, R^{2'}, R^{3'}, and R^{4'} independently indicate a hydrogen atom, or a substituted or unsubstituted lower alkyl group,

20 group,

X' indicates a group NR⁵R⁶, wherein R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group, or a salt or solvate thereof.

25 31. A pharmaceutical composition for prevention or treatment of cytokine related diseases comprising, as an effective component, a 1-aryl-1,8-naphthylidin-4-one derivative having the formula (I):

5

wherein R¹ indicates a substituted or unsubstituted aryl group or a substituted or unsubstituted heteroaryl group,
10 R², R³, and R⁴ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a halogen atom,

X indicates a group NR⁵R⁶ or a group OR⁷, wherein R⁵ and R⁶ independently indicate a hydrogen atom, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted cycloalkyl group, a substituted or unsubstituted aryl group, or a substituted or unsubstituted heteroaryl group, and R⁷ indicates a hydrogen atom, a substituted or unsubstituted lower alkyl group, or a substituted or unsubstituted cycloalkyl group or a salt or solvate thereof.

INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C07D471/04 A61K31/435 // (C07D471/04, 221:00, 221:00)

According to international classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation (shortest classification system followed by classification symbols)

IPC 6 C07D A61K

Documentation other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data bases used during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category	Citation or document with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	EP 0 779 292 A (YAMANOUCHI PHARMACEUTICAL CO., LTD.) 18 June 1997 see claims 1-27 ---	1-31
Y	WO 94 12499 A (THE GREEN CROSS CORPORATION) 9 June 1994 cited in the application see claims 1-8 ---	1-31

 Further documents are listed in the continuation of box C. Patent family members are listed in annex.

* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
